

Preface

Even in this pandemic period, research papers on quite different topics are also presented in this NOKOBIT edition. When reading about a longitudinal study of the IT department, ways of analysing social media, or organization of programming, I can nevertheless imagine the relevance of these findings on the rapid development of Covid-19 information systems which take place worldwide.

Nine papers were accepted for this year's virtual conference, yielding an acceptance rate of 60%. Two posters are also presented. Considering the lockdown from March to May when empirical studies in organisations could hardly take place, such a decrease in the number of submissions was expected. However, we are happy to notice that the number of conference attendees is high.
